

INFINICUS – Phase Expansion Prompt

You are the Lead Product Architect, Principal Software Engineer, UX Designer, Systems Architect, Legal Technology Architect, and AI Workflow Engineer for the Infinicus Engine.

Your objective is **not** to rebuild the existing project. Instead, analyze the current codebase, understand every existing module, and intelligently extend it with the features below while maintaining compatibility with the current architecture.

Core Rules

- Never replace working functionality unless an improvement is objectively necessary.
 - Extend existing components before creating new ones.
 - Maintain scalability, modularity, and clean architecture.
 - Produce production-ready code.
 - Ensure every feature integrates naturally into the current UI/UX.
 - Complete one implementation at a time before moving to the next.
 - After every completed feature, explain what was changed, why it was changed, and how it integrates with the rest of the engine.
-

PHASE 1 — Persistent Simulation Intelligence

Redesign the simulation persistence system.

Every completed simulation must become a permanent business intelligence asset rather than a temporary result.

Each saved simulation must store:

- Complete simulation inputs
- AI reasoning
- Assumptions
- Financial models
- Market analysis
- Competitor analysis
- SWOT analysis
- Risk analysis
- Revenue forecasts
- Charts
- Graphs
- Timeline
- Expansion strategy
- All generated reports

- AI recommendations
- Every visual panel generated during the simulation

Nothing should be lost.

The engine must recreate every saved simulation exactly as it originally appeared.

PHASE 2 — Interactive Simulation Replay

Users must be able to reopen any previous simulation.

Opening an old simulation should restore:

- Dashboard
- Financial panels
- Charts
- Graphs
- Reports
- Decisions
- AI reasoning
- Market conditions used
- Country settings
- Business assumptions

The experience should feel like reopening a saved professional project.

PHASE 3 — Editable Simulation Versions

Users should never be forced to start over.

When reopening a simulation they must be able to:

Duplicate Simulation

Edit Existing Simulation

Continue Simulation

Branch Simulation

Compare Versions

Every edited simulation should preserve version history.

Example

Simulation V1

↓

Simulation V2

↓

Simulation V3

↓

Simulation V4

Each version must remember what changed.

PHASE 4 — Intelligent History Center

Completely redesign the History panel.

When a user closes the browser, every simulation should automatically appear inside History.

History should include:

Search

Filters

Categories

Tags

Favorites

Recently Opened

Archived Simulations

Pinned Simulations

Simulation Status

Completion Date

Country

Industry

Business Stage

Estimated Investment

Growth Rating

Success Probability

Clicking any simulation should instantly restore the full workspace.

PHASE 5 — Business Comparison Workspace

Allow users to compare multiple simulations simultaneously.

Comparison should include:

Financial projections

Investment requirements

Profitability

Cash flow

Break-even point

Risk level

Competitor landscape

SWOT

Operational complexity

Market demand

Legal requirements

Growth potential

AI recommendation score

Display side-by-side comparison dashboards with visual graphs.

PHASE 6 — Complete Business Legal Intelligence

Transform Infinicus into a global legal preparation engine.

For every simulated business and country, determine:

Business registration requirements

Licenses

Permits

Tax registrations

Employment laws

Environmental requirements

Insurance requirements

Sector-specific regulations

Health and safety obligations

Import/export requirements

Data protection laws

Intellectual property registration

Trademark process

Patent requirements

Copyright requirements

Required certifications

Government approvals

Mandatory inspections

Annual compliance obligations

Renewal schedules

Business reporting obligations

Every requirement must explain:

Why it is needed

Who issues it

Estimated cost

Estimated processing time

Required documents

Renewal frequency

Risk of non-compliance

PHASE 7 — Required Documentation Generator

Generate a complete checklist of all documentation required before launching the business.

Separate into:

Personal documents

Business documents

Financial documents

Tax documents

Employment documents

Legal contracts

Operational documentation

Property documentation

Banking requirements

Insurance documentation

Digital compliance

Brand protection documents

Export/import documentation

Country-specific requirements

Users should be able to track completion progress.

PHASE 8 — Trusted Professional Marketplace

Build an integrated referral ecosystem.

When legal or business assistance is required, recommend verified professionals.

Categories include:

Law firms

Business registration companies

Tax consultants

Accountants

Financial advisors

Investment advisors

Trademark specialists

Patent attorneys

Auditors

Insurance providers

Business consultants

Marketing agencies

Technology providers

Recruitment firms

Each recommendation should display:

Company profile

Country served

Verified status

Services offered

Ratings

Estimated pricing

Languages

Website

Contact information

Booking or inquiry link

These recommendations should be sourced only from legitimate, registered, and trusted providers.

PHASE 9 — Country Intelligence Layer

Every simulation must automatically adapt to the selected country.

Country intelligence should dynamically adjust:

Taxes

Registration procedures

Legal requirements

Operating costs

Labour regulations

Minimum wages

Market size

Currency

Inflation

Import duties

Corporate laws

Business restrictions

Government incentives

Startup grants

Economic indicators

Industry-specific regulations

PHASE 10 — Interactive Learning Center

Create an integrated tutorial system.

Include:

First-time onboarding

Interactive walkthroughs

Step-by-step guided simulations

Tooltips

Context-sensitive help

Video tutorials

Knowledge base

Frequently Asked Questions

AI assistant guidance

Troubleshooting

Best practices

Business simulation examples

Users should never feel lost while using the engine.

PHASE 11 — Enterprise Architecture

Ensure every new feature follows:

Modular architecture

Reusable services

Scalable APIs

Secure authentication

Audit logs

Role-based permissions

Optimized database design

Cloud scalability

Performance optimization

Offline recovery

Automatic backups

Future AI model compatibility

Final Deliverables

For every completed phase provide:

1. Architecture explanation
2. Database schema updates
3. Backend implementation
4. Frontend implementation
5. API endpoints
6. Security considerations
7. UI/UX improvements
8. Testing strategy
9. Migration plan
10. Future expansion opportunities

Do not move to the next phase until the current phase is fully implemented, tested, documented, and integrated into the existing Infinicus codebase.
